

Project Case Study

Bulga Optimisation Project – 2015

Assurance Trees was contracted by Shearer Contracting to work under Downer EDI on the Bulga Optimisation Project. Starting in 2015 and continuing on an adhoc basis due to clearing restrictions. We were responsible for clearing of environmentally sensitive areas to the standards of TRANSGRID, GLENCORE and AUSTRALIAN DEFENCE FORCE. The project had many environmental conditions and was highly complex as there were three clients involved in some areas of the project that extended across multiple sites. This project involved the following aspects:

- Submission of pre-works WHSQ&E documentation and extensive review procedures with mining officials and multiple stakeholders.
- Generic inductions, drug testing and site specific familiarisation.
- Felling of habitat trees with ecologists. Felling of large trees near public roads and site access roads and tracks. Clearing and poisoning of vegetation around waterways and erosion prone areas within the 5km easement. Creation of artificial habitat and repositioning of habitat along the easement boundary to accommodate wildlife.
- The work was completed by a team of 2 arborists within 6 months from commencement
- There were strict EPA guidelines and environmental KPI's for the project as this was of a state significance.
- Total value of the project was approximately \$95,000.00
